

The Superchips Vigilante Allows Fuel-Injected Harley-Davidson™ Owners To Easily Tune Their Motorcycle

Superchips Vigilante Delivers More Performance, Cooler Operating Temperatures and Improved Throttle Response - All in an Easy-To-Use Tuning Solution

SANFORD, FL. – Superchips, Inc., the industry leading aftermarket tuning company for over 27-years, announces the Superchips Vigilante fuel-injected Harley-Davidson tuning solution.

The Vigilante is the first motorcycle tuning solution from Superchips and includes many successful technologies and innovations from their truck, car and Jeep tuning business. The Vigilante is easy-to-use, optimizes your H-D's performance and eliminates the limitations found in other tuning solutions. Tune to dial in your bike for better power, improved throttle response, superior mid-range performance, and lower engine operating temperature.

“Just about a year ago, we looked into the fuel-injected touring motorcycle market and saw some real opportunity to bring Superchips' innovation to Harley Davidson owners,” said Tom Bennett, division president for Superchips. “The Vigilante is an advanced but intuitive tuning solution that focuses on getting the most out of your Harley.”

The state-of-the-art Vigilante includes an easy-to-use laptop based software and wireless dongle. The dongle plugs in to the diagnostic connector and allows the user to install advanced tuning features in the factory ECU using Superchips flash technology instead of replacing the computer or using an in-line fool device. Just plug it in, sync the device to a laptop, tune the bike, put it away and ride. No need to leave the device hooked to the bike.

Bob Earley, R&D application lead of Superchips added, “We designed the Vigilante to put the performance of a Harley into the owner's hands allowing them do more with their bike. We are breaking down technology barriers with the ability to return the factory ECU to stock, live tune, auto tune and the quick switch feature which really sets the Vigilante apart.”

The Vigilante is the most powerful and flexible flash tuning solution in the industry and has two expansion pack options. The first is the quick switch. The Superchips Vigilante is able to install two sets of maps in the factory ECU allowing you to switch instantly between the two using a handlebar-mounted switch. For instance, if you are in traffic you may want to run the maps to let your bike run cooler or if you are on the highway, you may to run performance maps. Just hit the switch and instantly change your bike's tuning. The second is the wide band O2 sensor module for Auto Tuning allowing you to tune your bike using air/fuel targets. This tuning option is a quick and easy tuning solution for many bikes.

The other major feature of the Vigilante is Live Tuning which allows you to keep the bike running on the dyno and tune it in real time with instant data feedback saving time and money. Shutting the bike down and reflashing after each dyno run is a cumbersome and time consuming process for the do-it-yourself or professional tuner. Live Tuning is a real bottom-line advantage for the professional tuner and repair shop.

Pricing and Availability

Superchips Vigilante will be available through local and chain motorcycle stores, service shops as well as through online retailers in February of 2011.
